

Winning Space Race with Data Science

Gabriela Zúñiga Poblete
May 2, 2024

Outline

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

Executive Summary

The goal of this research is to analyze SpaceX Falcon 9 data collected through various sources and employ Machine Learning models to predict the success of first stage landing that provides other space agencies the ability to decide if they bid against SpaceX.

- Summary of methodologies
 - Following concepts and methods were used to collect and analyze data, build and evaluate machine learning models, and make predictions:
 - Collect data through API and Web scraping
 - Transform data through data wrangling
 - Conduct exploratory data analysis with SQL and data visuals
 - Build an interactive map with folium to analyze launch site proximity
 - Build a dashboard to analyze launch records interactively with Plotly Dash
 - Finally, build a predictive model to predict if the first stage of Falcon 9 will land successfully
- Summary of all results
 - This report will share results in various formats such as:
 - Data analysis results
 - Data visuals, interactive dashboards
 - Predictive model analysis results

Introduction

- Project background and context
 - With the recent successes in private space travel, space industry is becoming more and more mainstream and accessible to general population. Cost of launch continues to remain a key barrier for new competitors to enter the space race
 - SpaceX with its first stage reuse capabilities offers a key advantage against its competitors. Each SpaceX launch costs around 62 million dollar and SpaceX can reuse stage 1 for future launches. This provides SpaceX a unique advantage where other competitors are spending around 165 million plus for each launch
- Problems you want to find answers
 - Determine if the first stage of SpaceX Falcon 9 will land successfully
 - Impact of different parameters/variables on the landing outcomes (e.g., launch site, payload mass, booster version, etc.)
 - Correlations between launch sites and success rates

Section 1

Methodology

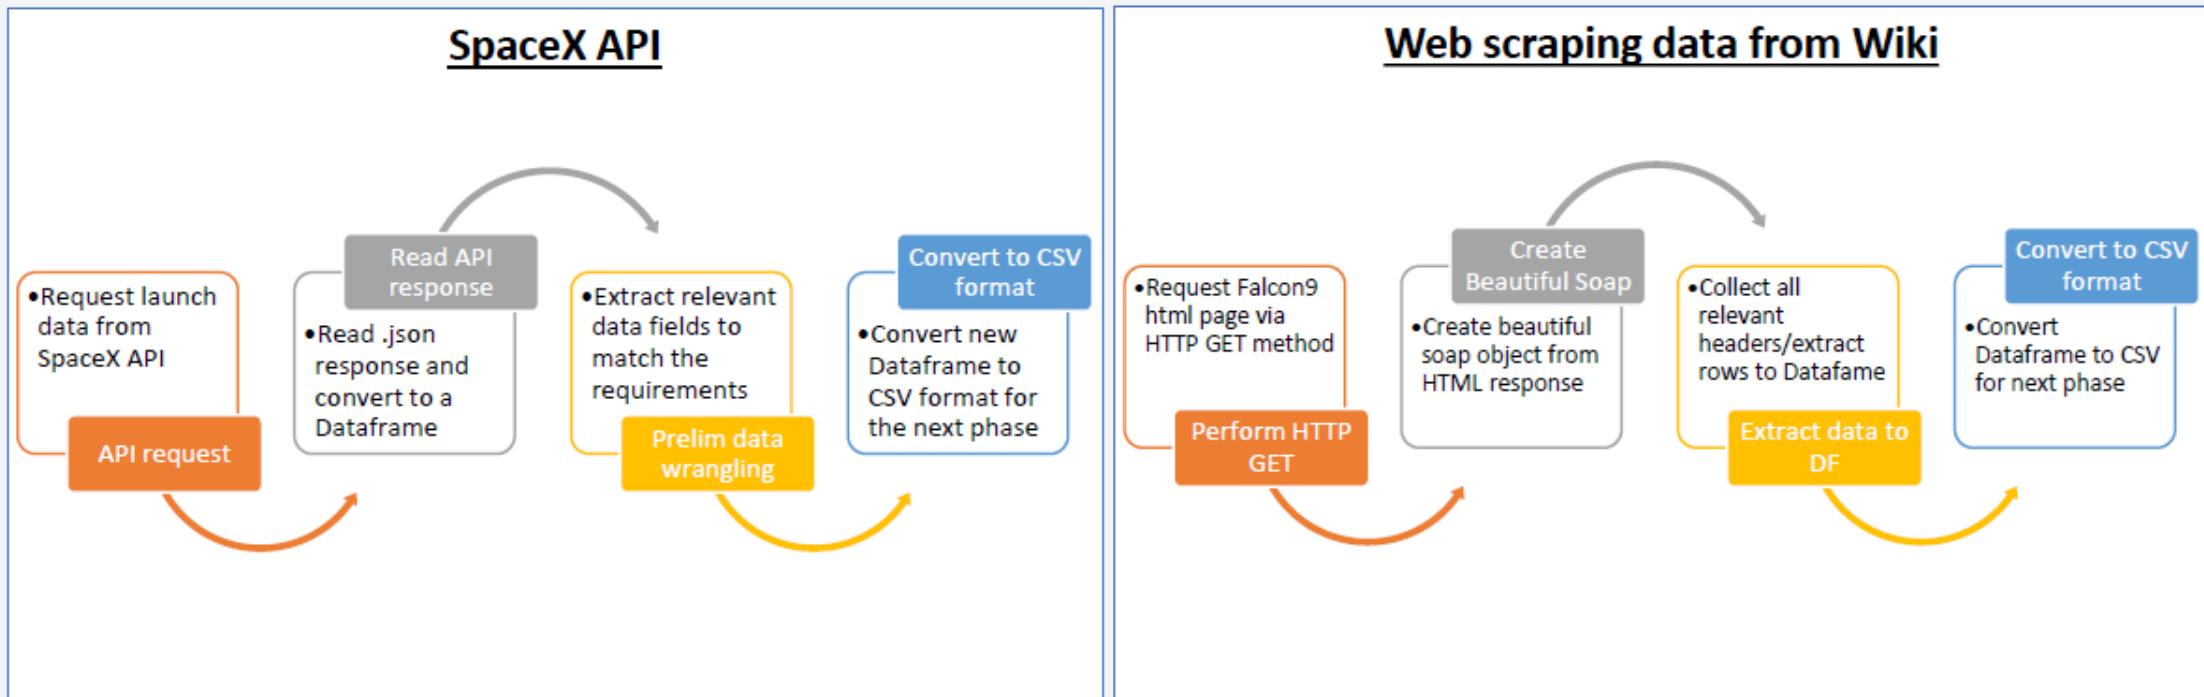

Methodology

Executive Summary

- Data collection methodology:
 - SpaceX API
 - Web scrap Falcon 9 and Falcon Heavy launch records from Wikipedia ([link](#))
- Perform data wrangling
 - Determined labels for training the supervised models by converting mission outcomes in to training labels (0-unsuccessful, 1-successful)
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - Created a column for 'class'; standardized and transformed data; train/test split data; find best classification algorithm (Logistic regression, SVM, decision tree, & KNN) using test data

Data Collection

- Data collection is the process of gathering data from available sources. This data can be structured, unstructured, or semi-structured. For this project, data was collected via SpaceX API and Web scrapping Wiki pages for relevant launch data.

Data Collection – SpaceX API

1. API Request and read response into DF

2. Declare global variables

3. Call helper functions with API calls to populate global vars

4. Construct data using dictionary

5. Convert Dict to Dataframe, filter for Falcon9 launches, covert to CSV

1. Create API GET request, normalize data and read in to a Dataframe:

```
spacex_url="https://api.spacexdata.com/v4/launches/past"  
  
response = requests.get(spacex_url)  
  
# Use json_normalize meethod to convert the json  
data = pd.json_normalize(response.json())
```

2. Declare global variable lists that will store data returned by helper functions with additional API calls to get relevant data

```
#Global variables  
BoosterVersion = []  
PayloadMass = []  
Orbit = []  
LaunchSite = []  
Outcome = []  
Flights = []  
GridFins = []  
Reused = []  
Legs = []  
LandingPad = []  
Block = []  
ReusedCount = []  
Serial = []  
Longitude = []  
Latitude = []
```

3. Call helper functions to get relevant data where columns have IDs (e.g., rocket column is an identification number)

- getBoosterVersion(data)
- getLaunchSite(data)
- getPayloadData(data)
- getCoreData(data)

4. Construct dataset from received data & combine columns into a dictionary:

```
launch_dict = {'FlightNumber': list(data['flight_number']),  
'Date': list(data['date']),  
'BoosterVersion':BoosterVersion,  
'PayloadMass':PayloadMass,  
'Orbit':Orbit,  
'LaunchSite':LaunchSite,  
'Outcome':Outcome,  
'Flights':Flights,  
'GridFins':GridFins,  
'Reused':Reused,  
'Legs':Legs,  
'LandingPad':LandingPad,  
'Block':Block,  
'ReusedCount':ReusedCount,  
'Serial':Serial,  
'Longitude': Longitude,  
'Latitude': Latitude}
```

4. Create Dataframe from dictionary and filter to keep only the Falcon9 launches:

```
# Create a data from Launch_dict  
df_launch = pd.DataFrame(launch_dict)
```

```
# Hint data['BoosterVersion']!='Falcon 1'  
data_falcon9 = df_launch[df_launch['BoosterVersion']!='Falcon 1']
```

```
data_falcon9.to_csv('dataset_part\1.csv', index=False)
```

Data Collection - Scraping

1. Perform HTTP GET to request HTML page

2. Create Beautiful Soap object

3. Extract column names from HTML table header

4. Create Dictionary with keys from extracted column names

5. Call helper functions to fill up dict with launch records

6. Convert Dictionary to Dataframe

1. Create API GET method to request Falcon9 launch HTML page

```
static_url = "https://en.wikipedia.org/w/index.php?title=List_of_Falcon_9_and_Falcon_Heavy_Launches&oldid=1027686922"  
  
html_data = requests.get(static_url).text
```

2. Create Beautiful Soap object

```
soup = BeautifulSoup(html_data, "html.parser")
```

3. Find all the tables on the Wiki page and extract relevant column names from the HTML table header

```
html_tables = soup.find_all ('table')  
  
column_names = []  
  
# Apply find_all() function with 'th' element on first table  
# Iterate each th element and apply the provided extract_colnames function  
# Append the Non-empty column name ('if name is not None')  
colnames = soup.find_all('th')  
for x in range (len(colnames)):  
    name2 = extract_column_from_header(colnames[x])  
    if (name2 is not None and len(name2) > 3):  
        column_names.append(name2)
```

4. Create an empty Dictionary with keys from extracted column names:

```
launch_dict= dict.fromkeys(column_names)  
  
# Remove an irrelevant column  
del launch_dict['Date and time ( )']  
  
# Let's initial the launch_dict with each value as an empty list  
launch_dict['Flight No.'] = []  
launch_dict['Launch site'] = []  
launch_dict['Payload'] = []  
launch_dict['Payload mass'] = []  
launch_dict['Orbit'] = []  
launch_dict['Customer'] = []  
launch_dict['Launch outcome'] = []  
# Added some new columns  
launch_dict['Version Booster']=[]  
launch_dict['Booster landing']=[]  
launch_dict['Date']=[]  
launch_dict['Time']=[]
```

5. Fill up the launch_dict with launch records extracted from table rows.

- Utilize following helper functions to help parse HTML data

```
def date_time(table_cells):
```

```
def booster_version(table_cells):
```

```
def landing_status(table_cells):
```

```
def get_mass(table_cells):
```

6. Convert launch_dict to Dataframe:

```
df=pd.DataFrame(launch_dict)
```

Data Wrangling

- Conducted Exploratory Data Analysis (EDA) to find patterns in data and define labels for training supervised models
- The data set contained various mission outcomes that were converted into Training Labels with 1 meaning the booster successfully landed and 0 meaning booster was unsuccessful in landing. Following landing scenarios were considered to create labels:
 - True Ocean means the mission outcome was successfully landed to a specific region of the ocean
 - False Ocean means the mission outcome was unsuccessfully landed to a specific region of the ocean
 - RTLS means the mission outcome was successfully landed to a ground pad
 - False RTLS means the mission outcome was unsuccessfully landed to a ground pad
 - True ASDS means the mission outcome was successfully landed on a drone ship
 - False ASDS means the mission outcome was unsuccessfully landed on a drone ship

Data Wrangling

1. Load dataset in to Dataframe

- Load SpaceX dataset (csv) in to a Dataframe

```
df=pd.read_csv("https://cf-courses-data.s3.us.cloud-object-storage.appd  
art_1.csv")
```

2. Find patterns in data

- Find data patterns:

- Calculate the number of launches on each site

```
df['LaunchSite'].value_counts()
```

CCAFS	SLC 40	55
KSC	LC 39A	22
VAFB	SLC 4E	13

- Calculate the number and occurrence of each orbit

```
df['Orbit'].value_counts()
```

GTO	27
ISS	21
VLEO	14
PO	9
LEO	7
SSO	5
MEO	3
GEO	1
HEO	1
SO	1
ES-L1	1

- Calculate number/occurrence of mission outcomes per orbit type

```
landing_outcomes = df['Outcome'].value_counts()
```

3. Create landing outcome label

- Create a landing outcome label from Outcome column in the Dataframe

```
# Landing_class = 0 if bad_outcome  
# landing_class = 1 otherwise
```

```
landing_class = []  
for i in df['Outcome']:  
    if i in bad_outcomes:  
        landing_class.append(0)  
    else:  
        landing_class.append(1)
```

```
df['Class']=landing_class  
df[['Class']].head(8)
```

Class
0
0
0
0
0
0

0

EDA with Data Visualization

- As part of the Exploratory Data Analysis (EDA), following charts were plotted to gain further insights into the dataset:

1. Scatter plot:

- Shows relationship or correlation between two variables making patterns easy to observe
- Plotted following charts to visualize:
 - Relationship between Flight Number and Launch Site
 - Relationship between Payload and Launch Site
 - Relationship between Flight Number and Orbit Type
 - Relationship between Payload and Orbit Type

2. Bar Chart:

- Commonly used to compare the values of a variable at a given point in time. Bar charts makes it easy to see which groups are highest/common and how other groups compare against each other. Length of each bar is proportional to the value of the items that it represents
- Plotted following Bar chart to visualize:
 - Relationship between success rate of each orbit type

3. Line Chart:

- Commonly used to track changes over a period of time. It helps depict trends over time.
- Plotted following Line chart to observe:
 - Average launch success yearly trend

EDA with SQL

- To better understand SpaceX data set, following SQL queries/operations were performed on an IBM DB2 cloud instance:
 1. Display the names of the unique launch sites in the space mission
 2. Display 5 records where launch sites begin with the string 'CCA'
 3. Display the total payload mass carried by boosters launched by NASA (CRS)
 4. Display average payload mass carried by booster version F9 v1.1
 5. List the date when the first successful landing outcome in ground pad was achieved.
 6. List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000
 7. List the total number of successful and failure mission outcomes
 8. List the names of the booster_versions which have carried the maximum payload mass. Use a subquery
 9. List the failed landing_outcomes in drone ship, their booster versions, and launch site names for in year 2015
 10. Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order

Build an Interactive Map with Folium

- Folium interactive map helps analyze geospatial data to perform more interactive visual analytics and better understand factors such location and proximity of launch sites that impact launch success rate.
- Following map object were created and added to the map:
 - Mark all launch sites on the map. This allowed to visually see the launch sites on the map.
 - Added 'folium.circle' and 'folium.marker' to highlight circle area with a text label over each launch site.
 - Added a 'MarkerCluster()' to show launch success (green) and failure (red) markers for each launch site.
 - Calculated distances between a launch site to its proximities (e.g., coastline, railroad, highway, city)
 - Added 'MousePosition()' to get coordinate for a mouse position over a point on the map
 - Added 'folium.Marker()' to display distance (in KM) on the point on the map (e.g., coastline, railroad, highway, city)
 - Added 'folium.Polyline()' to draw a line between the point on the map and the launch site
 - Repeated steps above to add markers and draw lines between launch sites and proximities – coastline, railroad, highway, city)
- Building the Interactive Map with Folium helped answered following questions:
 - Are launch sites in close proximity to railways? YES
 - Are launch sites in close proximity to highways? YES
 - Are launch sites in close proximity to coastline? YES
 - Do launch sites keep certain distance away from cities? YES

Build a Dashboard with Plotly Dash

- Built a Plotly Dash web application to perform interactive visual analytics on SpaceX launch data in real-time. Added Launch Site Drop-down, Pie Chart, Payload range slide, and a Scatter chart to the Dashboard.
 1. Added a Launch Site Drop-down Input component to the dashboard to provide an ability to filter Dashboard visual by all launch sites or a particular launch site
 2. Added a Pie Chart to the Dashboard to show total success launches when 'All Sites' is selected and show success and failed counts when a particular site is selected
 3. Added a Payload range slider to the Dashboard to easily select different payload ranges to identify visual patterns
 4. Added a Scatter chart to observe how payload may be correlated with mission outcomes for selected site(s). The color-label Booster version on each scatter point provided missions outcomes with different boosters
- Dashboard helped answer following questions:
 1. Which site has the largest successful launches? [KSC LC-39A](#) with 10
 2. Which site has the highest launch success rate? [KSC LC-39A](#) with 76.9% success
 3. Which payload range(s) has the highest launch success rate? 2000 – 5000 kg
 4. Which payload range(s) has the lowest launch success rate? 0-2000 and 5500 - 7000
 5. Which F9 Booster version (v1.0, v1.1, FT, B4, B5, etc.) has the highest launch success rate? [FT](#)

Predictive Analysis (Classification)

1. Read dataset into Dataframe and create a 'Class' array

2. Standardize the data

3. Train/Test/Split data in to training and test data sets

4. Create and Refine Models

5. Find the best performing Model

1. Load SpaceX dataset (csv) in to a Dataframe and create NumPy array from the column class in data

```
data = pd.read_csv("https://cf-courses-data.s3.us.cloud-object  
et_part_2.csv")
```

```
Y = data['Class'].to_numpy()
```

2. Standardize data in X then reassign to variable X using transform

```
X= preprocessing.StandardScaler().fit(X).transform(X)
```

3. Train/test/split X and Y in to training and test data sets.

```
# Split data for training and testing data sets  
from sklearn.model_selection import train_test_split  
X_train, X_test, Y_train, Y_test = train_test_split  
([X, Y, test_size=0.2, random_state=2)  
print ('Train set:', X_train.shape, Y_train.shape)  
print ('Test set:', X_test.shape, Y_test.shape)
```

4. Create and refine Models based on following classification Algorithms: (below is LR example)

- Create Logistic Regression object and then create a GridSearchCV object
- Fit train data set in to the GridSearchCV object and train the Model

```
parameters ={"C": [0.01,0.1,1], 'penalty': ['l2'], 'solver':['lbfgs']}  
LR = LogisticRegression()  
logreg_cv = GridSearchCV(LR, parameters, cv=10)  
logreg_cv.fit(X_train, Y_train)
```

- Find and display best hyperparameters and accuracy score

```
print("tuned hyperparameters :(best parameters) ",logreg_cv.best_params_)  
print("accuracy : ",logreg_cv.best_score_)
```

- Check the accuracy on the test data by creating a confusion matrix

```
yhat=logreg_cv.predict(X_test)  
plot_confusion_matrix(Y_test,yhat)
```

- Repeat above steps for Decision Tree, KNN, and SVM algorithms

3. Find the best performing model

```
Model_Performance_df = pd.DataFrame({'Algo Type': ['Logistic Regression', 'SVM', 'Decision Tree', 'KNN'],  
'Accuracy Score': [logreg_cv.best_score_, svm_cv.best_score_, tree_cv.best_score_, knn_cv.best_score_],  
'Test Data Accuracy Score': [logreg_cv.score(X_test, Y_test), svm_cv.score(X_test, Y_test),  
tree_cv.score(X_test, Y_test), knn_cv.score(X_test, Y_test)]})
```

```
i = Model_Performance_df['Accuracy Score'].idxmax()  
print('The best performing algorithm is ' + Model_Performance_df['Algo Type'][i]  
+ ' with score ' + str(Model_Performance_df['Accuracy Score'][i]))
```

The best performing algorithm is Decision Tree with score 0.875

	Algo Type	Accuracy Score	Test Data Accuracy Score
2	Decision Tree	0.875000	0.833333
3	KNN	0.848214	0.833333
1	SVM	0.848214	0.833333
0	Logistic Regression	0.846429	0.833333

Results

Following sections and slides explain results for:

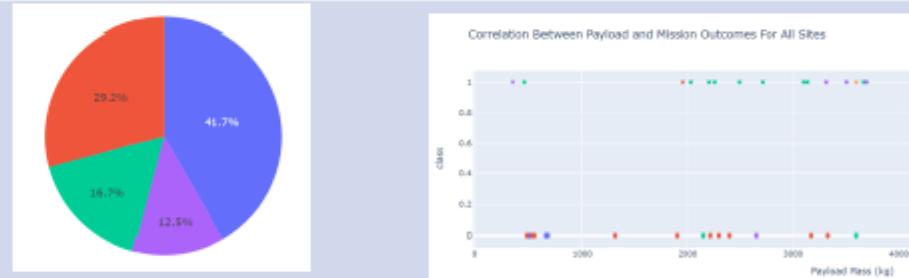

Exploratory data analysis results

- Samples:

Interactive analytics demo in screenshots

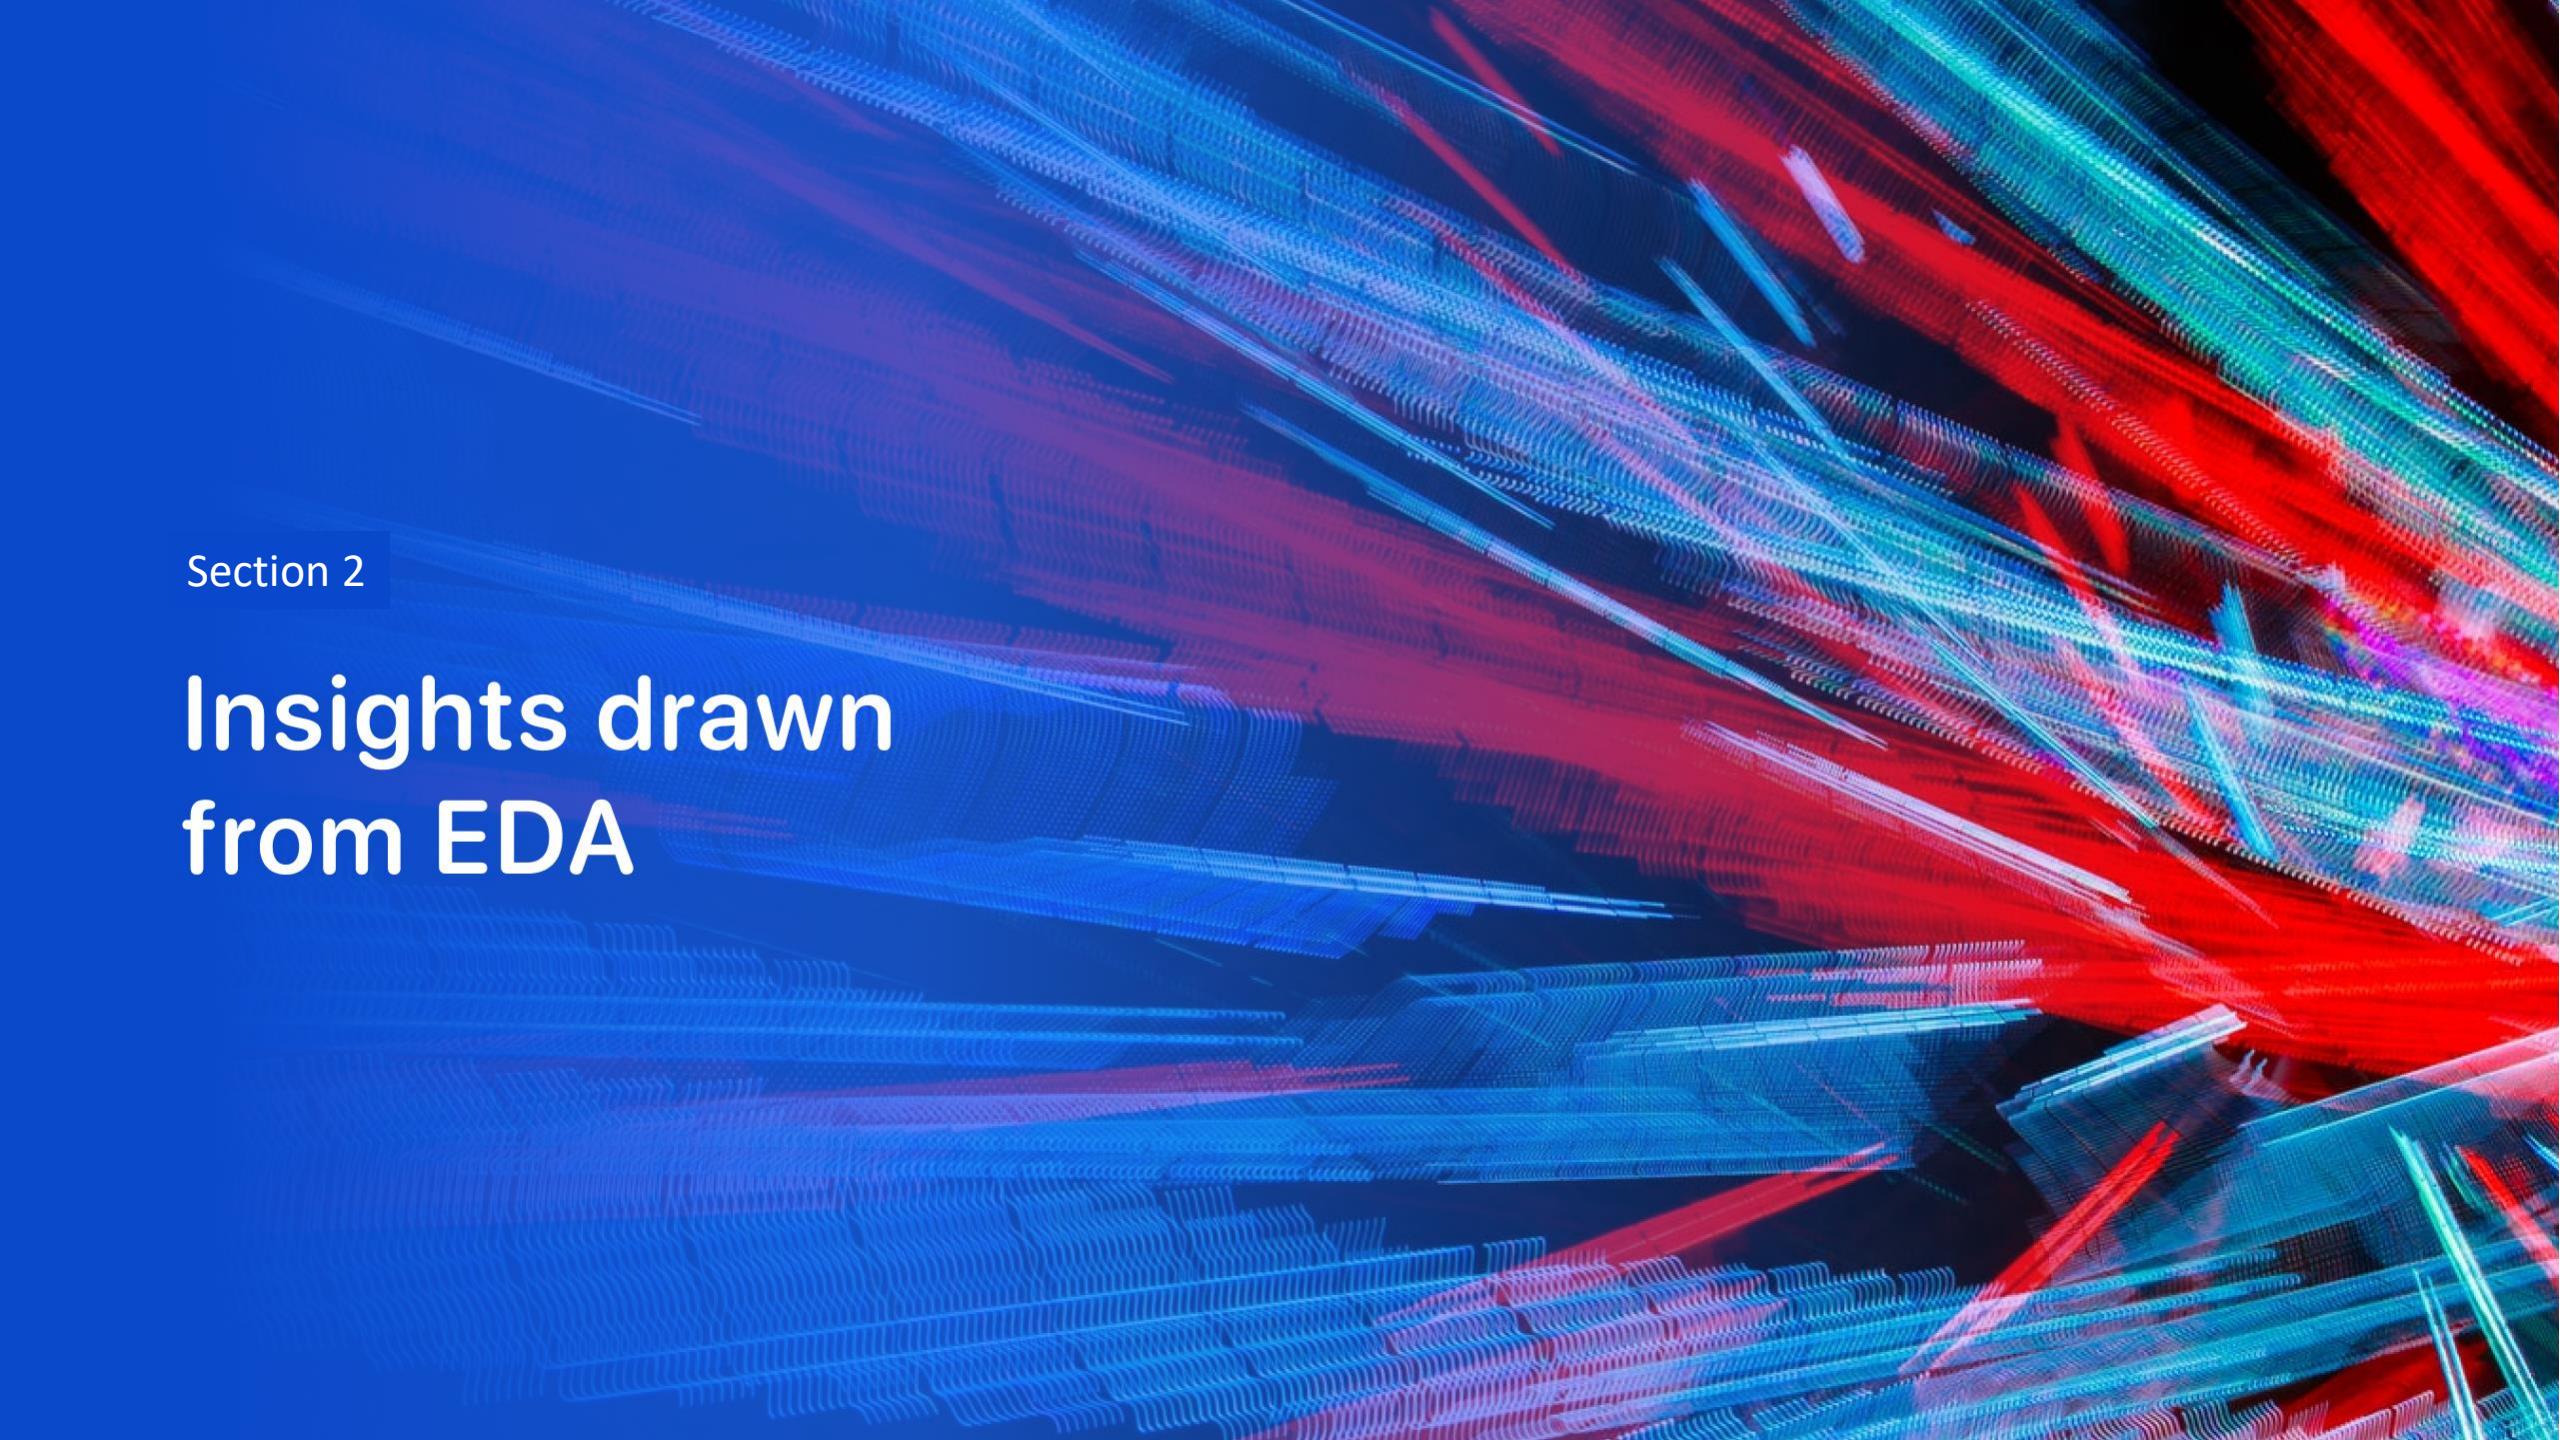

- Samples

Predictive analysis results

- Samples

	Algo Type	Accuracy Score
2	Decision Tree	0.903571
3	KNN	0.848214
1	SVM	0.848214
0	Logistic Regression	0.846429

The background of the slide features a complex, abstract digital visualization. It consists of numerous thin, glowing lines that create a sense of depth and motion. The lines are primarily blue and red, with some green and purple highlights. They form a grid-like structure that curves and twists across the frame, resembling a three-dimensional space or a network of data points. The overall effect is futuristic and dynamic.

Section 2

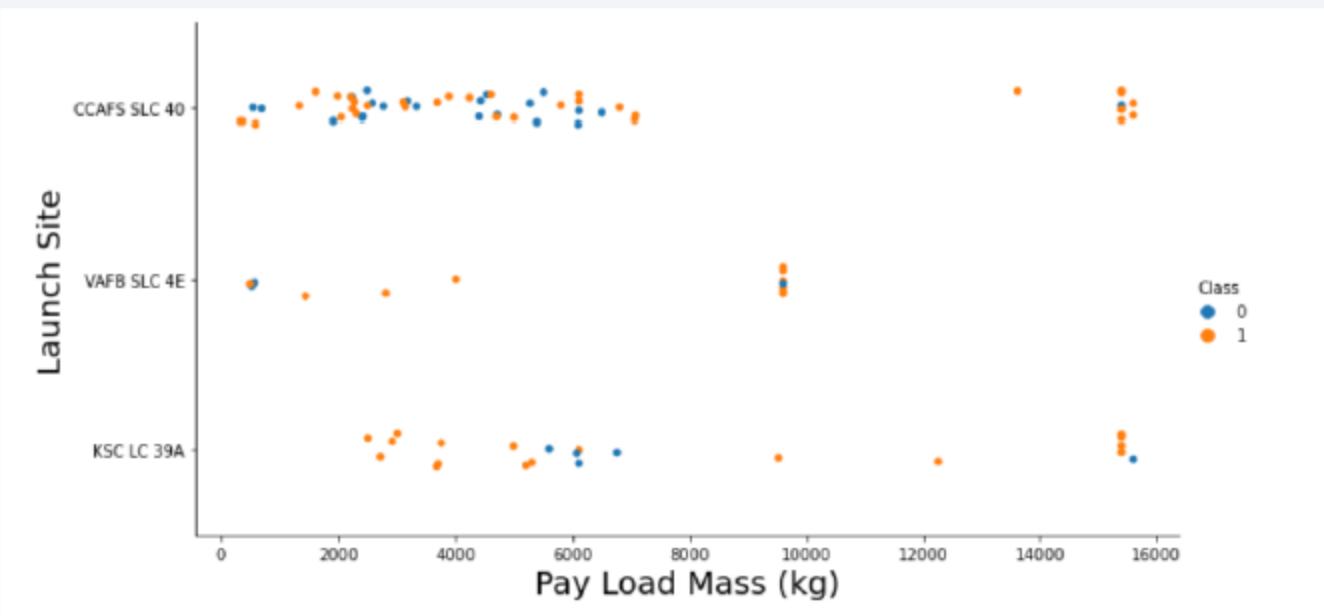

Insights drawn from EDA

Flight Number vs. Launch Site

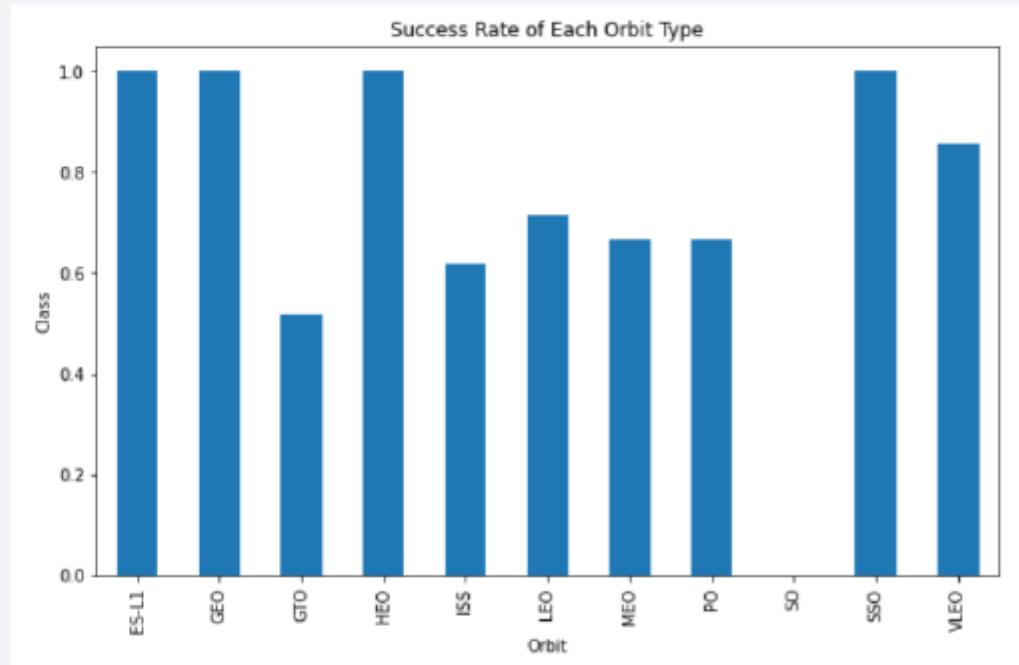

- Success rates (Class=1) increases as the number of flights increase
- For launch site 'KSC LC 39A', it takes at least around 25 launches before a first successful launch

Payload vs. Launch Site

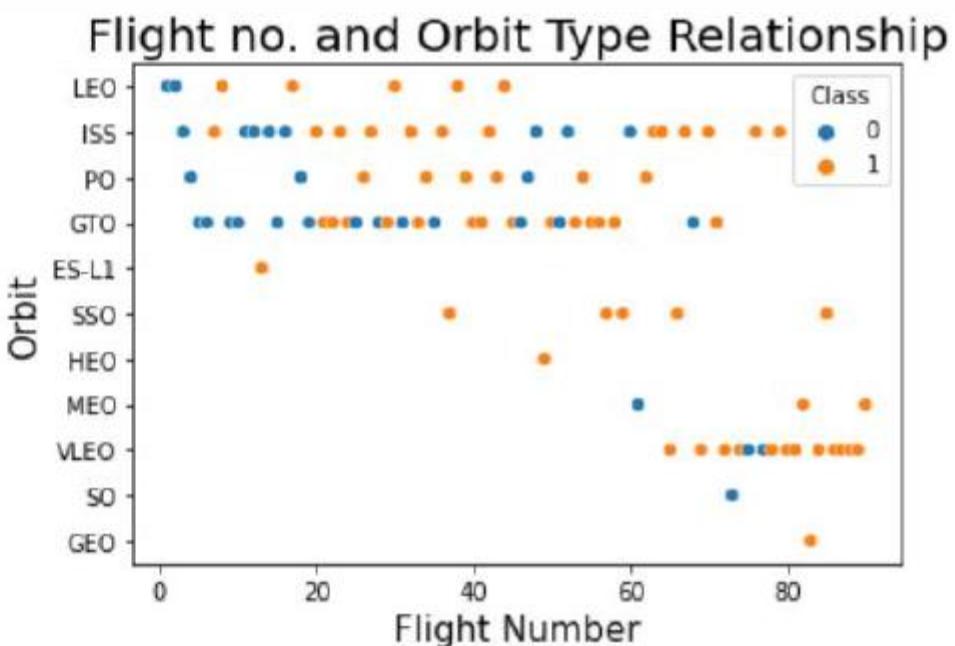

- For launch site 'VAFB SLC 4E', there are no rockets launched for payload greater than 10,000 kg
- Percentage of successful launch (Class=1) increases for launch site 'VAFB SLC 4E' as the payload mass increases
- There is no clear correlation or pattern between launch site and payload mass

Success Rate vs. Orbit Type

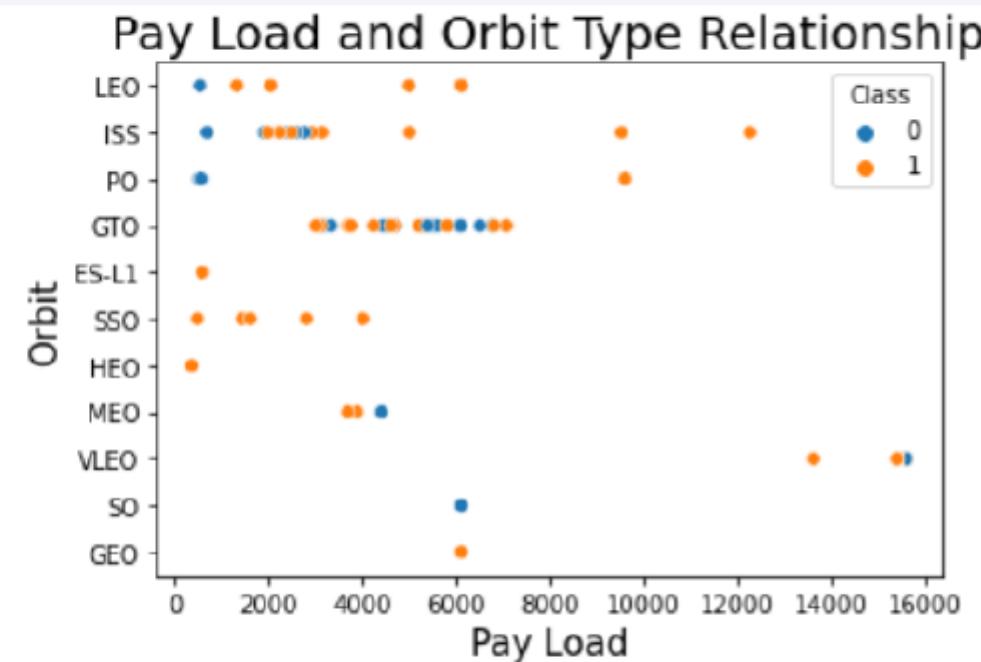

- Orbit types ES-LI, GEO, HEO, and SSO have the highest success rates
- GTO orbit has the lowest success rate

Flight Number vs. Orbit Type

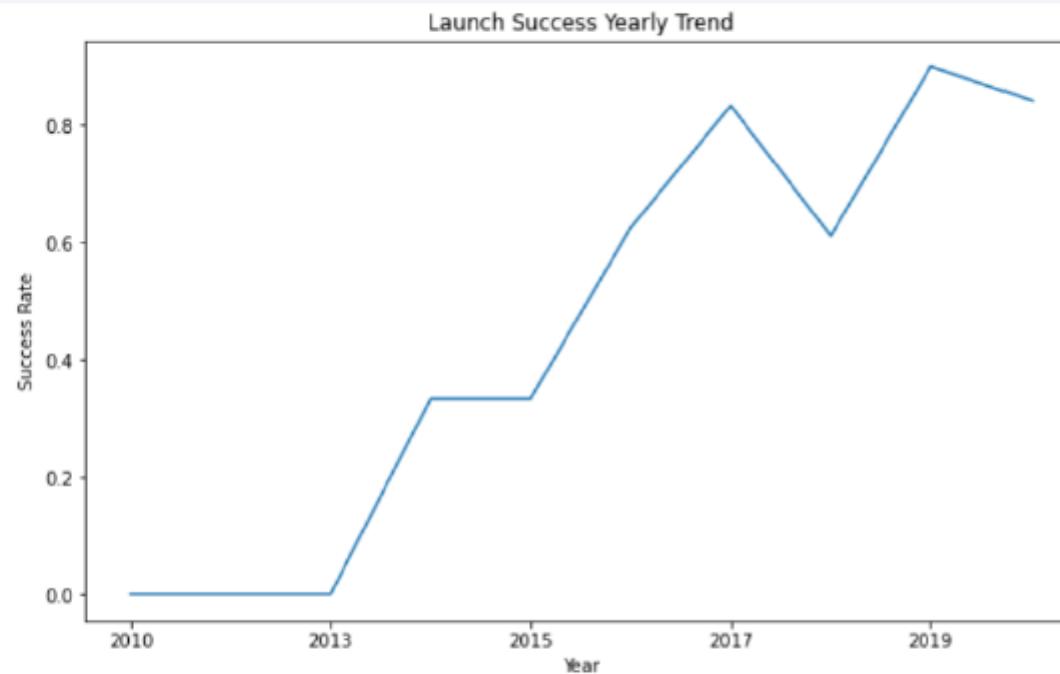

- For orbit VLEO, first successful landing (class=1) doesn't occur until 60+ number of flights
- For most orbits (LEO, ISS, PO, SSO, MEO, VLEO) successful landing rates appear to increase with flight numbers
- There is no relationship between flight number and orbit for GTO

Payload vs. Orbit Type

- Successful landing rates (Class=1) appear to increase with pay load for orbits LEO, ISS, PO, and SSO
- For GEO orbit, there is not clear pattern between payload and orbit for successful or unsuccessful landing

Launch Success Yearly Trend

- Success rate (Class=1) increased by about 80% between 2013 and 2020
- Success rates remained the same between 2010 and 2013 and between 2014 and 2015
- Success rates decreased between 2017 and 2018 and between 2019 and 2020

All Launch Site Names

- Query:

```
select distinct Launch_Site from spacextbl
```

- Description:

- 'distinct' returns only unique values from the queries column (Launch_Site)
- There are 4 unique launch sites

- Result:

launch_site
CCAFS LC-40
CCAFS SLC-40
KSC LC-39A
VAFB SLC-4E

Launch Site Names Begin with 'KSC'

Query

```
%sql select * from SPACEXTABLE where Launch_Site LIKE 'KSC%' limit 5
```

Description

- Using keyword 'Like' and format 'KSC%', returns records where 'Launch_Site' column starts with "KSC".
- Limit 5, limits the number of returned records to 5

Result

Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASS_KG_	Orbit	Customer	Mission_Outcome	Landing_Outcome	MONTH
2017-02-19	14:39:00	F9 FT B1031.1	KSC LC-39A	SpaceX CRS-10	2490	LEO (ISS)	NASA (CRS)	Success	Success (ground pad)	None
2017-03-16	6:00:00	F9 FT B1030	KSC LC-39A	EchoStar 23	5600	GTO	EchoStar	Success	No attempt	None
2017-03-30	22:27:00	F9 FT B1021.2	KSC LC-39A	SES-10	5300	GTO	SES	Success	Success (drone ship)	None
2017-05-01	11:15:00	F9 FT B1032.1	KSC LC-39A	NROL-76	5300	LEO	NRO	Success	Success (ground pad)	None
2017-05-15	23:21:00	F9 FT B1034	KSC LC-39A	Inmarsat-5 F4	6070	GTO	Inmarsat	Success	No attempt	None

Total Payload Mass

- Query:

```
select sum(PAYLOAD_MASS__KG_) from spacextbl where Customer = 'NASA (CRS)'
```

- Description:

- 'sum' adds column 'PAYLOAD_MASS_KG' and returns total payload mass for customers named 'NASA (CRS)'

- Result:

45596

Average Payload Mass by F9 v1.1

- Query:

```
select avg(PAYLOAD_MASS__KG_) from spacextbl where Booster_Version LIKE 'F9 v1.1'
```

- Description:

- ‘avg’ keyword returns the average of payload mass in ‘PAYLOAD_MASS_KG’ column where booster version is ‘F9 v1.1’

- Result:

2928

First Successful Ground Landing Date

- Query:

```
select min(Date) as min_date from spacextbl where Landing__Outcome = 'Success (ground pad)';
```

- Description:

- 'min(Date)' selects the first or the oldest date from the 'Date' column where first successful landing on group pad was achieved
- Where clause defines the criteria to return date for scenarios where 'Landing_Outcome' value is equal to 'Success (ground pad)'

- Result:

min_date
2015-12-22

Successful Drone Ship Landing with Payload between 4000 and 6000

- Query:

```
select Booster_Version from spacextbl where (PAYLOAD_MASS__KG_ > 4000 and PAYLOAD_MASS__KG_ < 6000)  
and (Landing__Outcome = 'Success (drone ship)');
```

- Description:

- The query finds the booster version where payload mass is greater than 4000 but less than 6000 and the landing outcome is success in drone ship
- The 'and' operator in the where clause returns booster versions where both conditions in the where clause are true

- Result:

booster_version
F9 FT B1022
F9 FT B1026
F9 FT B1021.2
F9 FT B1031.2

Total Number of Successful and Failure Mission Outcomes

- Query:

```
select Mission_Outcome, count(Mission_Outcome) as counts from spacextbl group by Mission_Outcome
```

- Description:

- The 'group by' keyword arranges identical data in a column in to group
- In this case, number of mission outcomes by types of outcomes are grouped in column 'counts'

- Result:

mission_outcome	counts
Failure (in flight)	1
Success	99
Success (payload status unclear)	1

Boosters Carried Maximum Payload

- Query:

```
select Booster_Version, PAYLOAD_MASS__KG_ from spacextbl where PAYLOAD_MASS__KG_ = (select max(PAYLOAD_MASS__KG_) from spacextbl)
```

- Description:

- The sub query returns the maximum payload mass by using keyword 'max' on the payload mass column
- The main query returns booster versions and respective payload mass where payload mass is maximum with value of 15600

booster_version	payload_mass__kg_
F9 B5 B1048.4	15600
F9 B5 B1049.4	15600
F9 B5 B1051.3	15600
F9 B5 B1056.4	15600
F9 B5 B1048.5	15600
F9 B5 B1051.4	15600
F9 B5 B1049.5	15600
F9 B5 B1060.2	15600
F9 B5 B1058.3	15600
F9 B5 B1051.6	15600
F9 B5 B1060.3	15600
F9 B5 B1049.7	15600

- Result:

2017 Launch Records

- **Query**

```
%sql select MONTH, Landing_Outcome, Booster_Version,Launch_site from SPACEXTABLE where(substr(Date,0,5)='2017' and Landing_Outcome='Success (ground pad)')
```

- **Description**

The query lists landing outcome, booster version, and the launch site where landing outcome is success in ground pad and the year is 2017

- The ‘and’ operator in the where clause returns booster versions where both conditions in the where clause are true
- The ‘year’ keyword extracts the year from column ‘Date’

- **Result**

MONTH	Landing_Outcome	Booster_Version	Launch_Site
FEB	Success (ground pad)	F9 FT B1031.1	KSC LC-39A
MAY	Success (ground pad)	F9 FT B1032.1	KSC LC-39A
JUN	Success (ground pad)	F9 FT B1035.1	KSC LC-39A
AUG	Success (ground pad)	F9 B4 B1039.1	KSC LC-39A
SEP	Success (ground pad)	F9 B4 B1040.1	KSC LC-39A
DEC	Success (ground pad)	F9 FT B1035.2	CCAFS SLC-40

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

- Query:

```
select Landing_Outcome, count(*) as LandingCounts from spacextbl where Date between '2010-06-04' and '2017-03-20'  
group by Landing_Outcome  
order by count(*) desc;
```

- Description:

- The 'group by' key word arranges data in column 'Landing_Outcome' into groups
- The 'between' and 'and' keywords return data that is between 2010-06-04 and 2017-03-20
- The 'order by' keyword arranges the counts column in descending order
- The result of the query is a ranked list of landing outcome counts per the specified date range

- Result:

landing_outcome	landingcounts
No attempt	10
Failure (drone ship)	5
Success (drone ship)	5
Success (ground pad)	5
Controlled (ocean)	3
Uncontrolled (ocean)	2
Failure (parachute)	1
Precluded (drone ship)	1

The background of the slide is a photograph taken from space at night. It shows the curvature of the Earth's horizon against a dark blue sky. City lights are visible as numerous small white and yellow dots, primarily concentrated in the lower right quadrant where a large urban area is illuminated. In the upper right corner, there is a faint, greenish glow of the aurora borealis or a similar atmospheric phenomenon.

Section 3

Launch Sites Proximities Analysis

SpaceX Falcon9 - Launch Sites Map

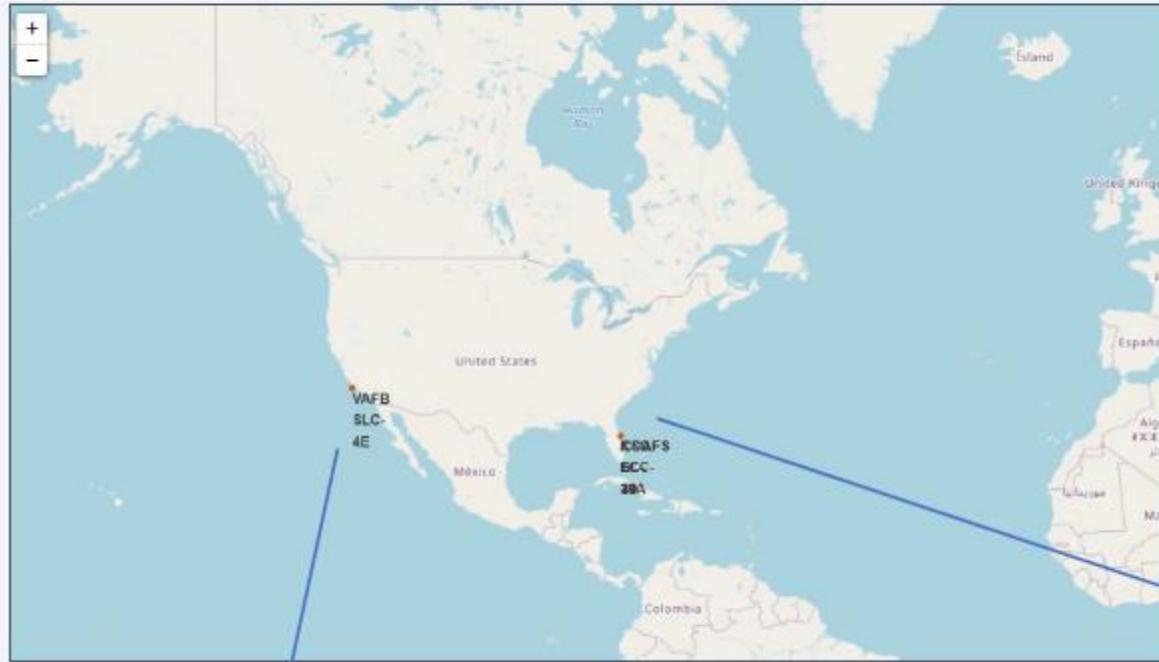

Fig 1 – Global Map

Fig 2 – Zoom 1

Figure 1 on left displays the Global map with Falcon 9 launch sites that are located in the United States (in California and Florida). Each launch site contains a circle, label, and a popup to highlight the location and the name of the launch site. It is also evident that all launch sites are near the coast.

Figure 2 and Figure 3 zoom in to the launch sites to display 4 launch sites:

- VAFB SLC-4E (CA)
- CCAFS LC-40 (FL)
- KSC LC-39A (FL)
- CCAFS SLC-40 (FL)

Fig 3 – Zoom 2

SpaceX Falcon9 – Success/Failed Launch Map for all Launch Sites

Fig 1 – US map with all Launch Sites

- Figure 1 is the US map with all the Launch Sites. The numbers on each site depict the total number of successful and failed launches
- Figure 2, 3, 4, and 5 zoom in to each site and displays the success/fail markers with green as success and red as failed
- By looking at each site map, KSC LC-39A Launch Site has the greatest number of successful launches

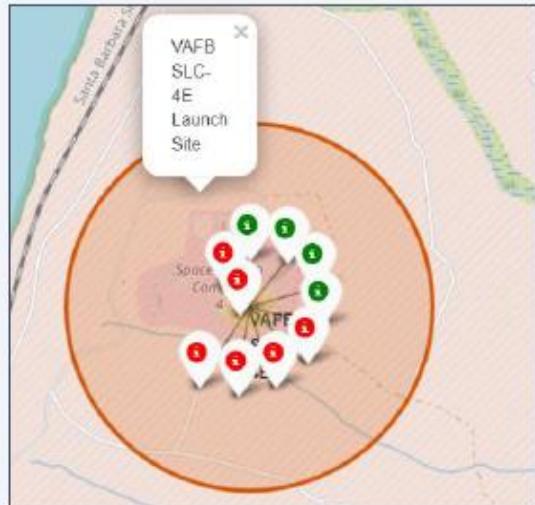

Fig 2 – VAFB Launch Site with success/failed markers

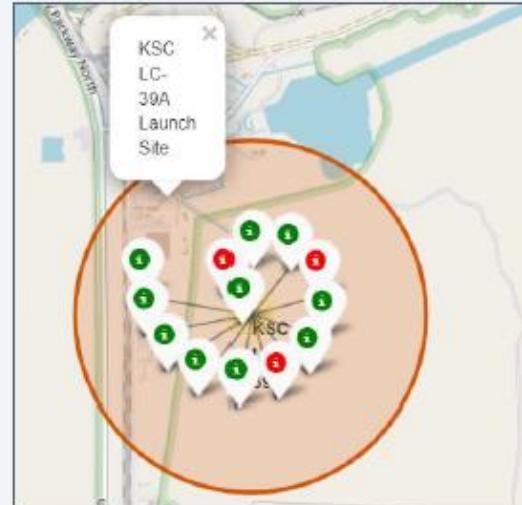

Fig 3 – KSC LC-39A success/failed markers

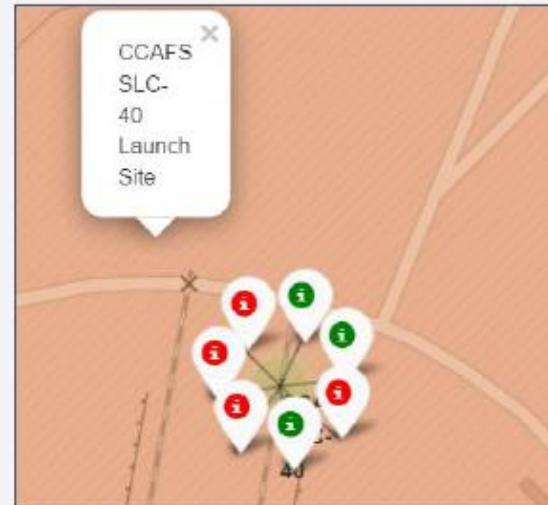

Fig 4 – CCAFS SLC-40 success/failed markers

Fig 5 – CCAFS SLC-40 success/failed markers

SpaceX Falcon9 – Launch Site to proximity Distance Map

Fig 1 – Proximity site map for VAFB SLC-4E

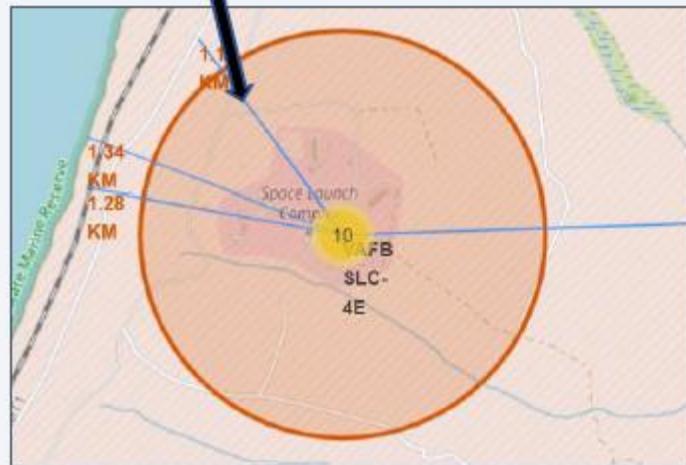

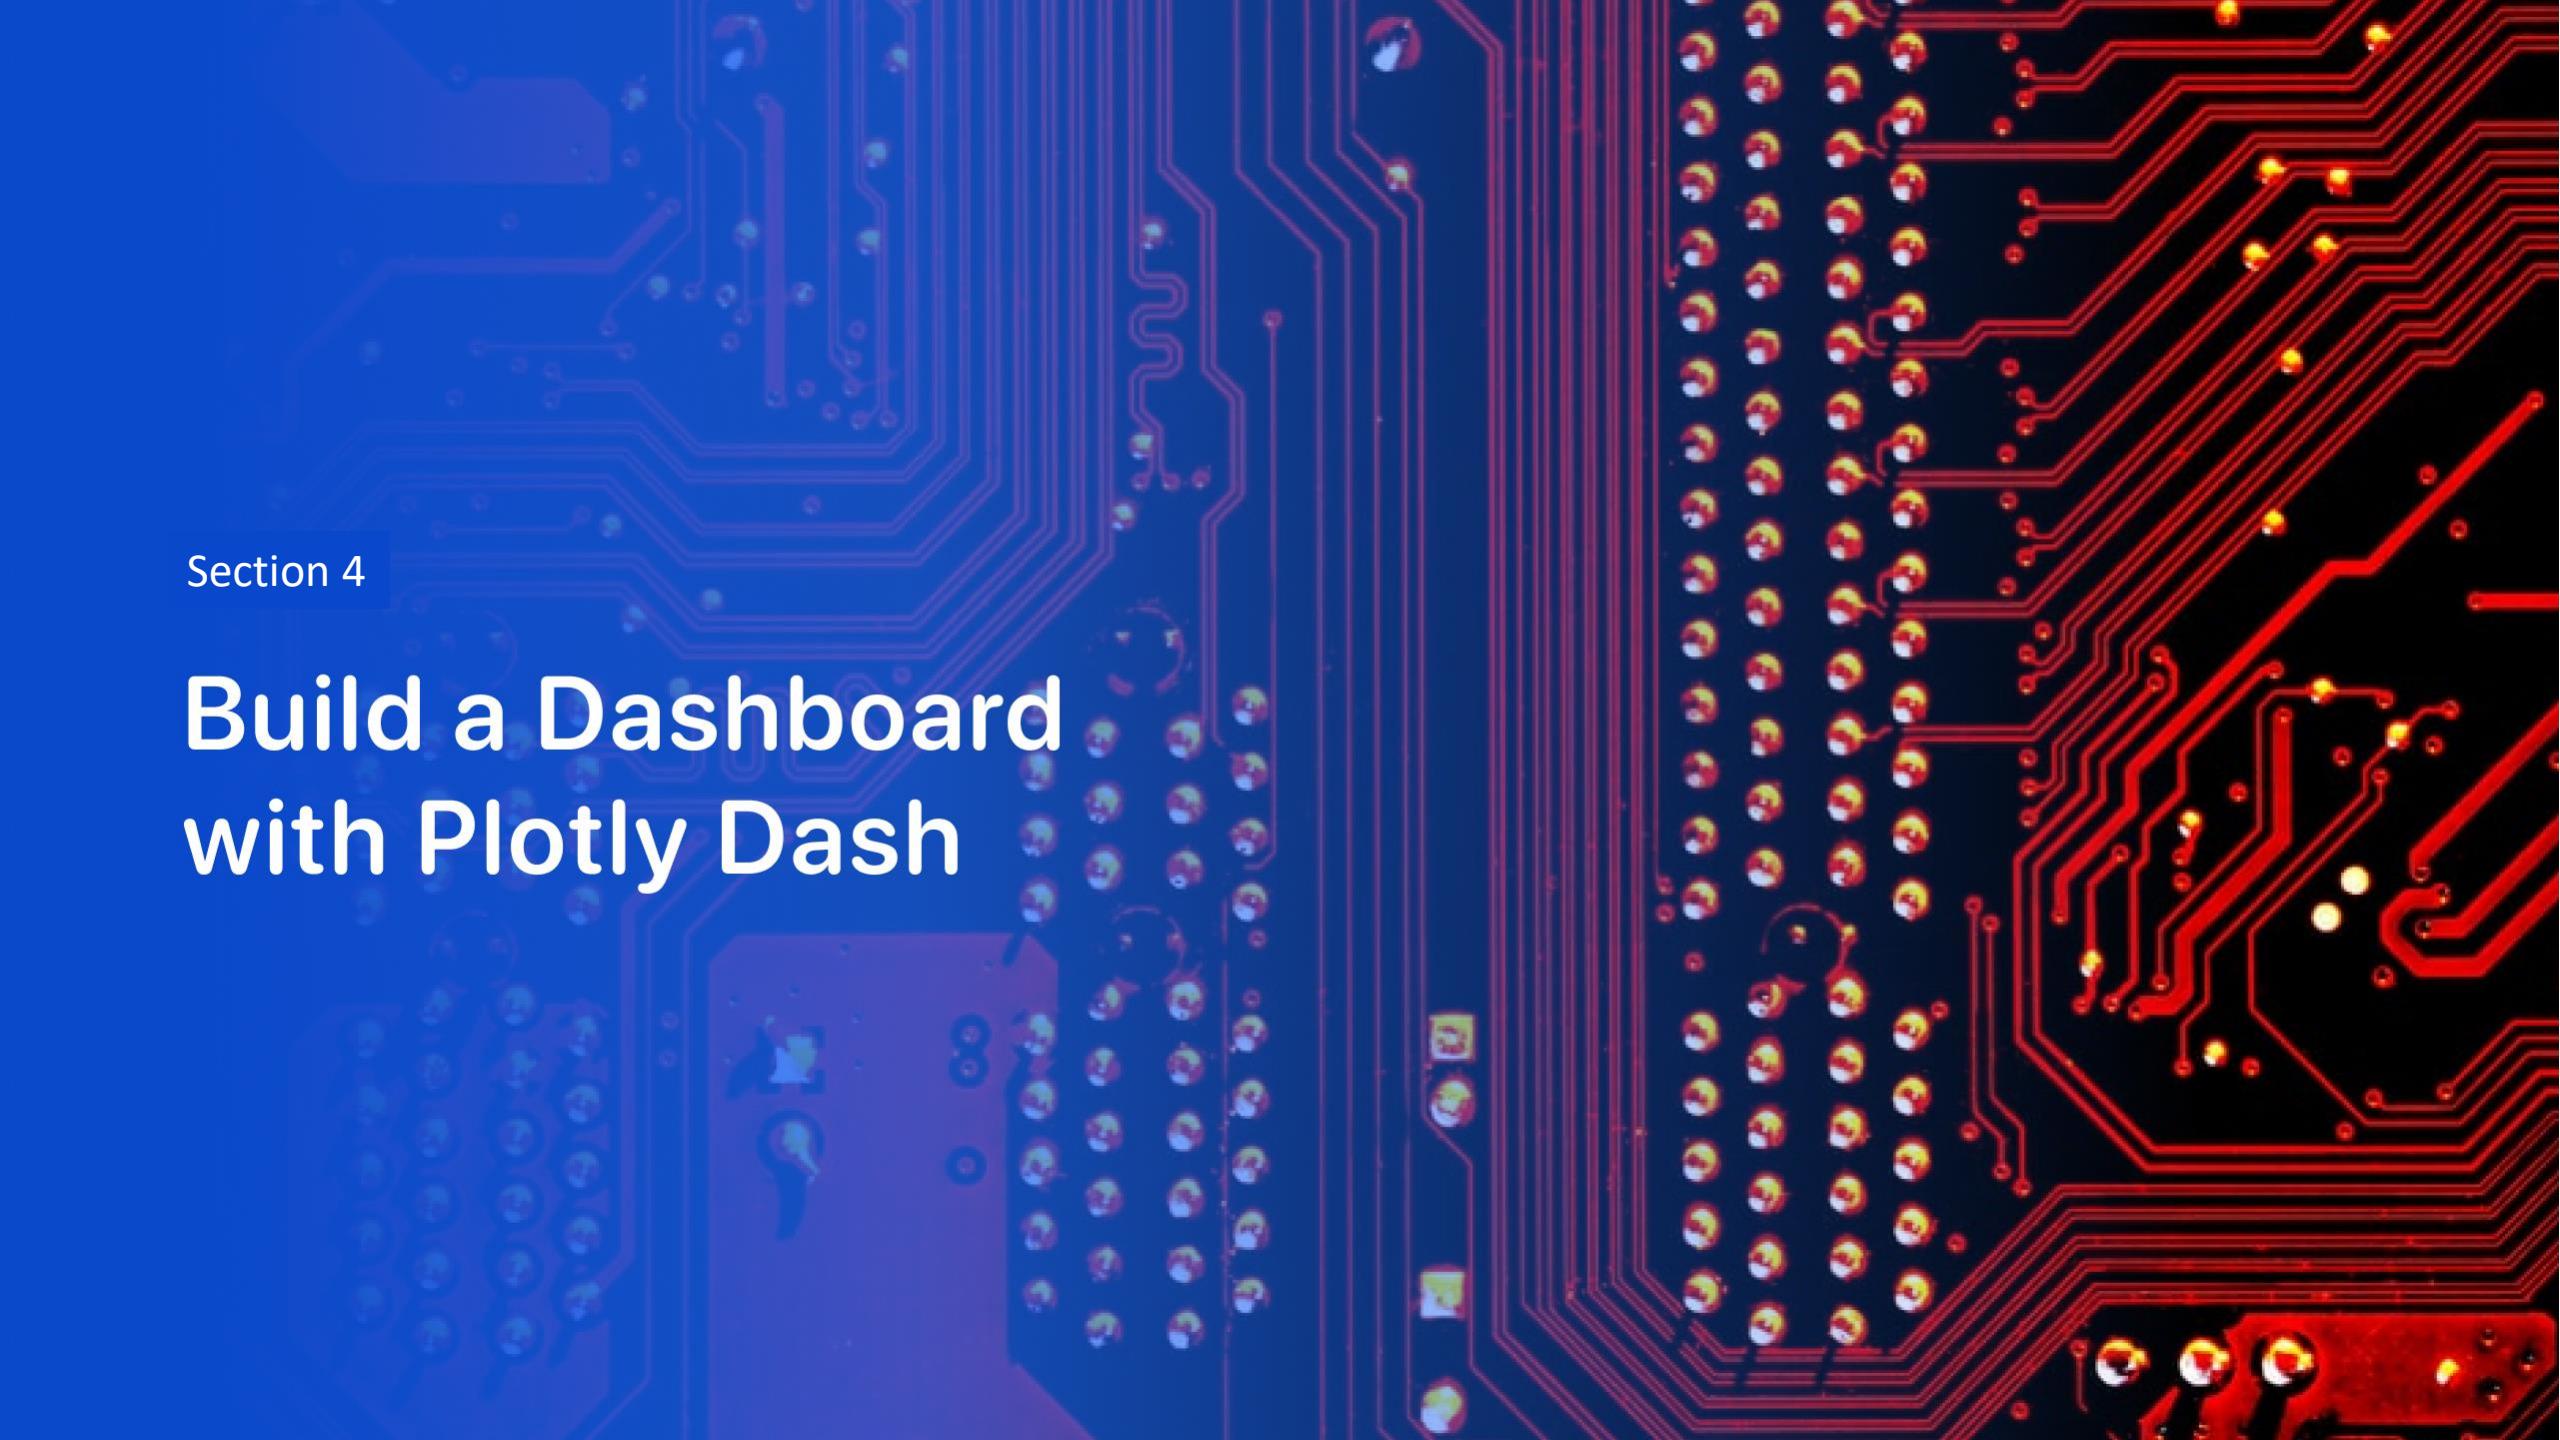

Fig 2 – Zoom in for sites – coastline, railroad, and highway

Figure 1 displays all the proximity sites marked on the map for Launch Site VAFB SLC-4E. City Lompoc is located further away from Launch Site compared to other proximities such as coastline, railroad, highway, etc. The map also displays a marker with city distance from the Launch Site (14.09 km)

Figure 2 provides a zoom in view into other proximities such as coastline, railroad, and highway with respective distances from the Launch Site

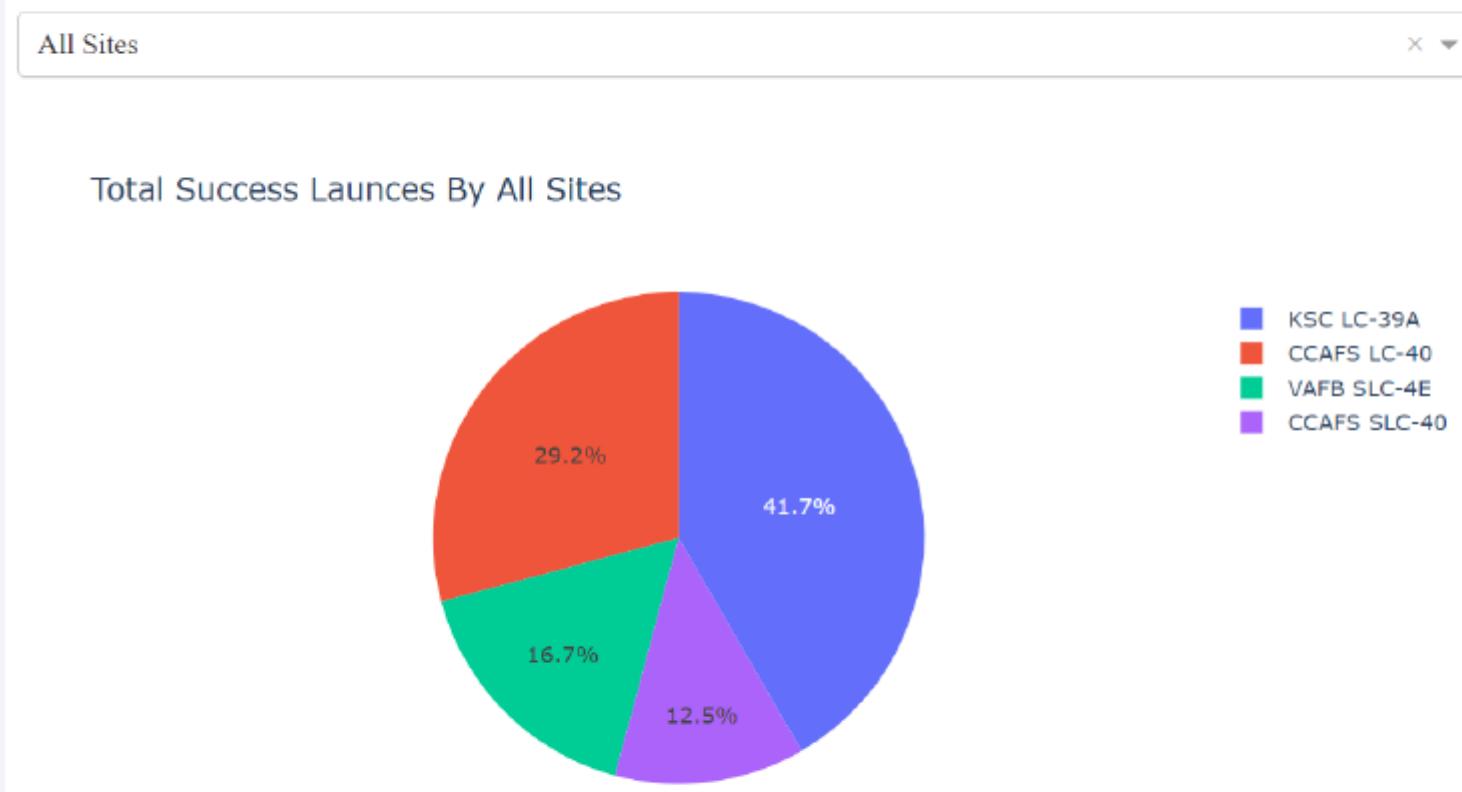

In general, cities are located away from the Launch Sites to minimize impacts of any accidental impacts to the general public and infrastructure. Launch Sites are strategically located near the coastline, railroad, and highways to provide easy access to resources.

The background of the slide features a close-up photograph of a printed circuit board (PCB). The left side of the image has a blue color overlay, while the right side has a red color overlay. The PCB itself is dark grey or black, with numerous red and blue printed circuit lines (traces) connecting various components. Components visible include a large integrated circuit chip on the left, several surface-mount resistors, capacitors, and other small electronic parts. A few yellow circular components, likely SMD capacitors, are also scattered across the board.

Section 4

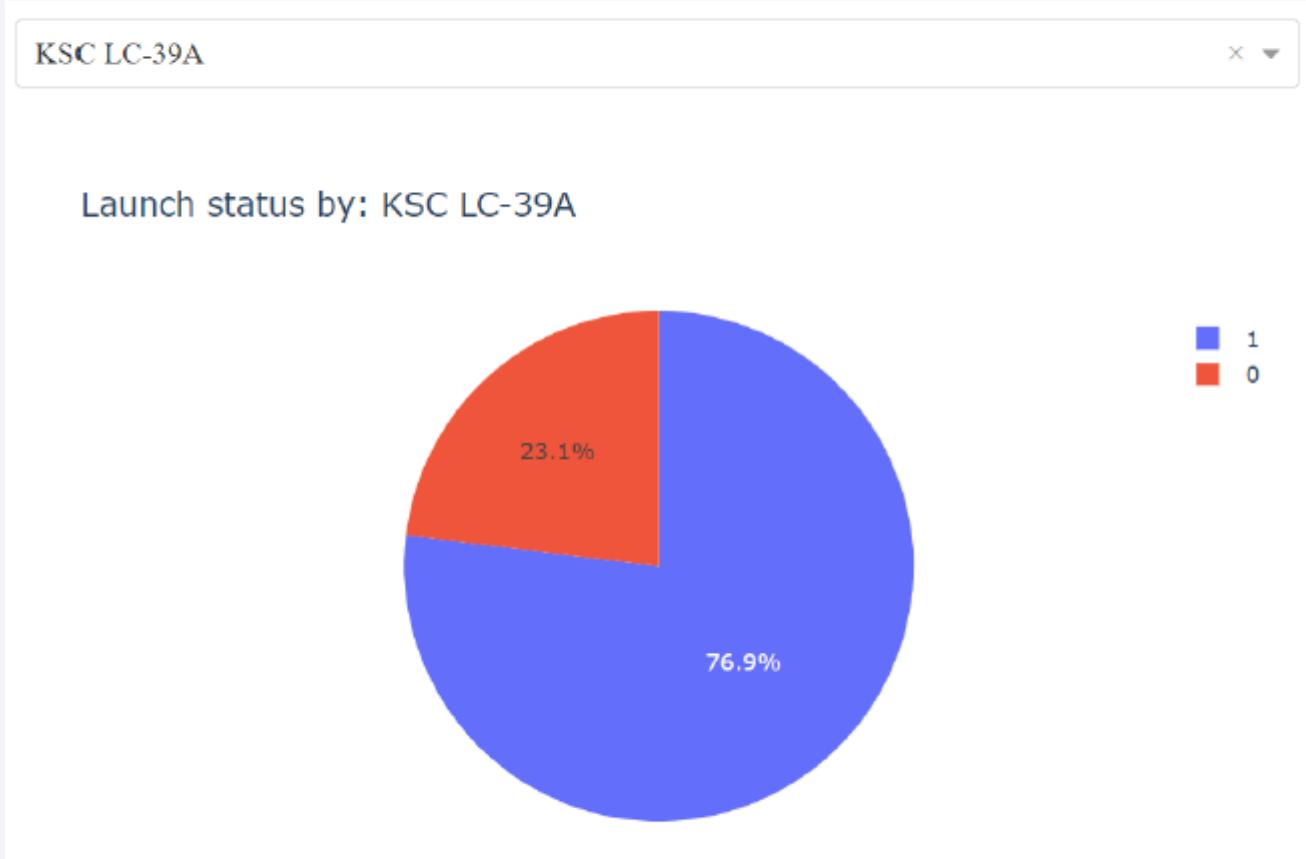

Build a Dashboard with Plotly Dash

Launch Success Counts For All Sites

- Launch Site 'KSC LC-39A' has the highest launch success rate
- Launch Site 'CCAFS SLC-40' has the lowest launch success rate

Launch Site with Highest Launch Success Ratio

- KSC LC-39A Launch Site has the highest launch success rate and count
- Launch success rate is 76.9%
- Launch success failure rate is 23.1%

Payload vs. Launch Outcome Scatter Plot for All Sites

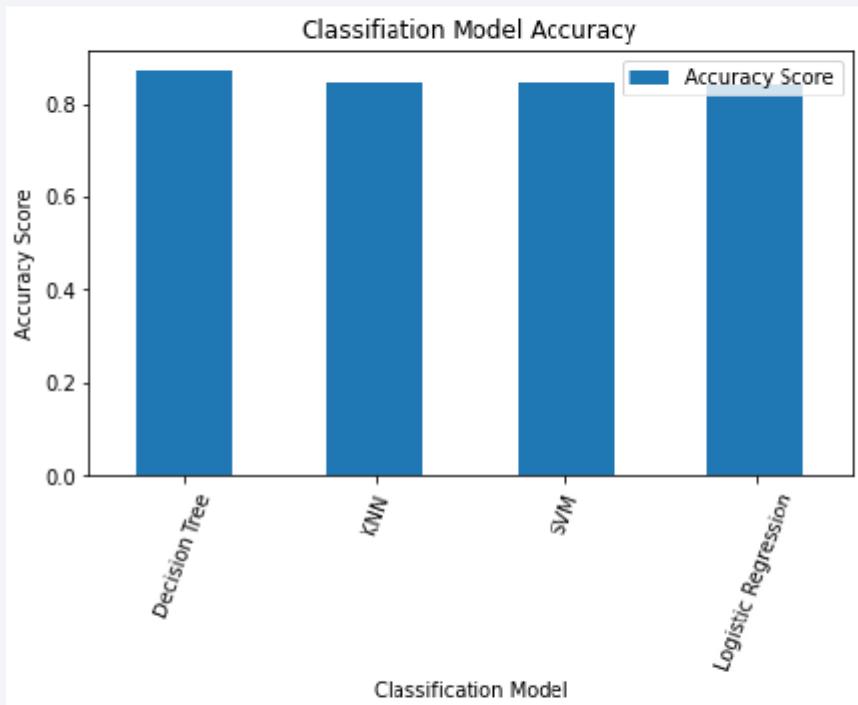

- Most successful launches are in the payload range from 2000 to about 5500
- Booster version category 'FT' has the most successful launches
- Only booster with a success launch when payload is greater than 6k is 'B4'

The background of the slide features a dynamic, abstract design. It consists of several curved, overlapping bands of color. A prominent band on the left is a deep blue, while another on the right is a bright yellow. These colors transition into lighter shades of blue and yellow towards the edges. The overall effect is one of motion and depth, resembling a tunnel or a stylized landscape.

Section 5

Predictive Analysis (Classification)

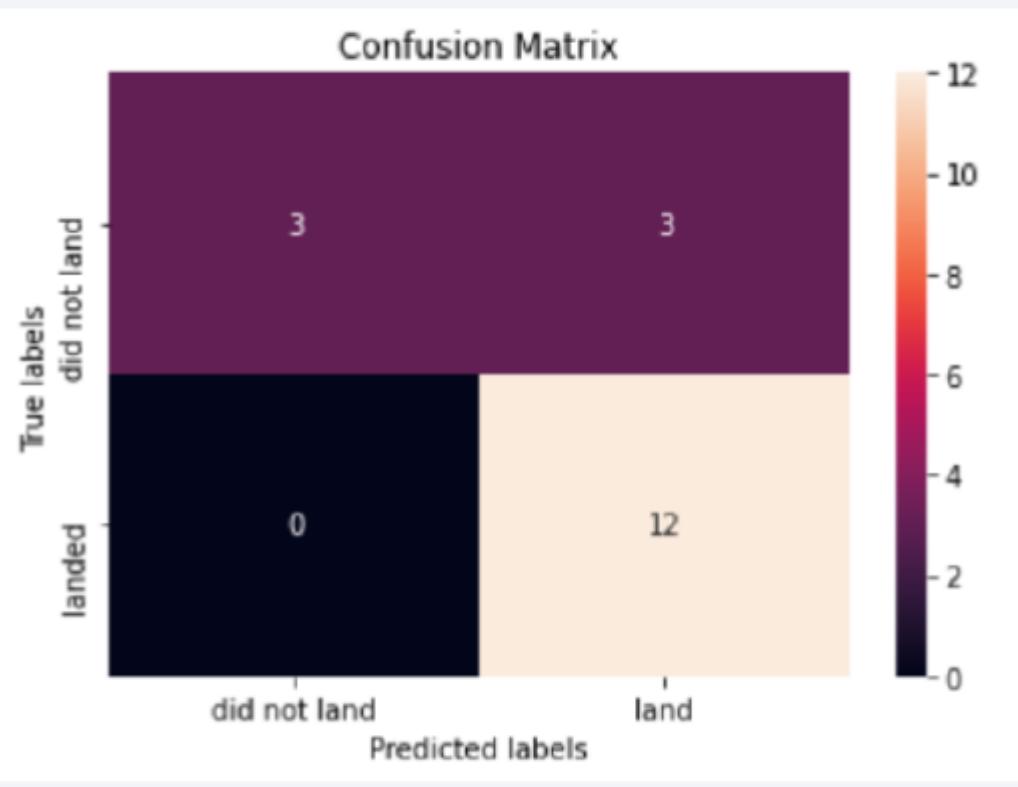

Classification Accuracy

- Based on the Accuracy scores and as also evident from the bar chart, Decision Tree algorithm has the highest classification score with a value of .8750
- Accuracy Score on the test data is the same for all the classification algorithms based on the data set with a value of .8333
- Given that the Accuracy scores for Classification algorithms are very close and the test scores are the same, we may need a broader data set to further tune the models

	Algo Type	Accuracy Score	Test Data Accuracy Score
2	Decision Tree	0.875000	0.833333
3	KNN	0.848214	0.833333
1	SVM	0.848214	0.833333
0	Logistic Regression	0.846429	0.833333

Confusion Matrix

- The confusion matrix is same for all the models (LR, SVM, Decision Tree, KNN)
- Per the confusion matrix, the classifier made 18 predictions
- 12 scenarios were predicted Yes for landing, and they did land successfully (True positive)
- 3 scenarios (top left) were predicted No for landing, and they did not land (True negative)
- 3 scenarios (top right) were predicted Yes for landing, but they did not land successfully (False positive)
- Overall, the classifier is correct about 83% of the time $((TP + TN) / \text{Total})$ with a misclassification or error rate $((FP + FN) / \text{Total})$ of about 16.5%

Conclusions

- As the numbers of flights increase, the first stage is more likely to land successfully
- Success rates appear go up as Payload increases but there is no clear correlation between Payload mass and success rates
- Launch success rate increased by about 80% from 2013 to 2020
- Launch Site 'KSC LC-39A' has the highest launch success rate and Launch Site 'CCAFS SLC-40' has the lowest launch success rate
- Orbits ES-L1, GEO, HEO, and SSO have the highest launch success rates and orbit GTO the lowest
- Launch sites are located strategically away from the cities and closer to coastline, railroads, and highways
- The best performing Machine Learning Classification Model is the Decision Tree with an accuracy of about 87.5%. When the models were scored on the test data, the accuracy score was about 83% for all models. More data may be needed to further tune the models and find a potential better fit.

Appendix

Thank you!
